

Packaging services for the medical technology and healthcare industry

Packaging Medical Devices

- Packaging Material
- Cleaning & Rinsing
- Quality Inspections

Following production, medical devices must be subjected to an appropriate cleaning and disinfection process to remove micro-biological impurities and germs. Various packaging solutions can then be applied, such as blister, pouches or vials.

Packaging Development

- Packaging Design
- Label Design & Printing
- Assembly & Testing

Our solutions focus on usability, functionality and medical regulatory compliance. We develop sterile packaging systems as single or multiple barriers that can be expanded into a complete logistics friendly packaging system.

Sterilization

- Sterilization Validations
- Recording Test Results
- Sterilization Auditing

Packaged and labeled medical devices are sterilized according to customer standards and regulatory requirements. Predefined material properties are the determining factor in the selection of the appropriate sterilization process.

Validations

- Cleaning Validation
- Packaging Validation
- Transport Validation

Validation procedures include proof of efficiency, sterilization at different loads and dose ranges, securing biocompatibility of the medical device and packaging, as well as shelf life and transportation stability.
